

Session 4: Thermoconomics I

Techno-Economic Analysis of Sub-critical ORC with optimized Heat Transfer Process

Wei Liu, Dominik Meinel, Christoph Wieland and Hartmut Spleithoff
Institute for Energy Systems
Technische Universität München

3rd International Seminar on ORC Power Systems

October 12-14, 2015, Brussels, Belgium

Agenda

1. Motivation

2. Approach

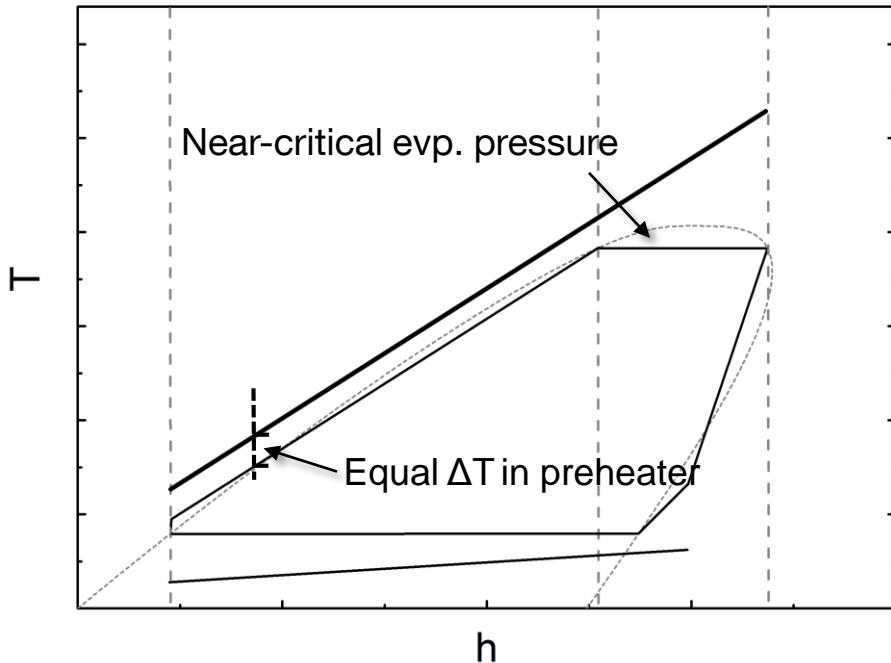

- Input Parameters
- Thermodynamic Model
- Economic Model
- Target Function

3. Results

4. Conclusions & Future works

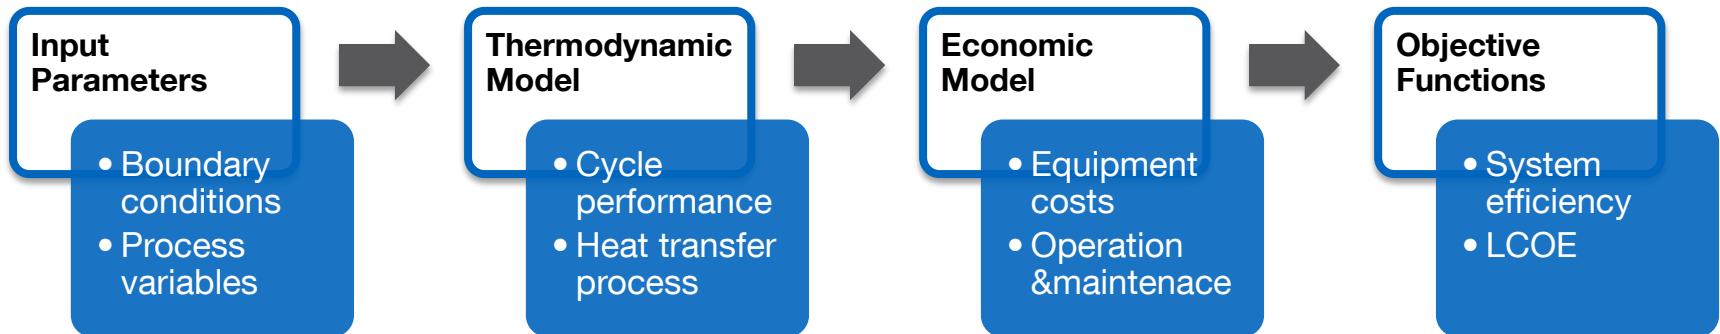

1. Motivation

A thermodynamically optimal heat transfer process for sub-critical ORC.

- + High exergetic efficiency
 - + High system efficiency
 - High evaporation pressure
 - Large heat transfer area
-
- ❖ Technically feasible?
 - ❖ Economically viable?

2. Approach - Overview

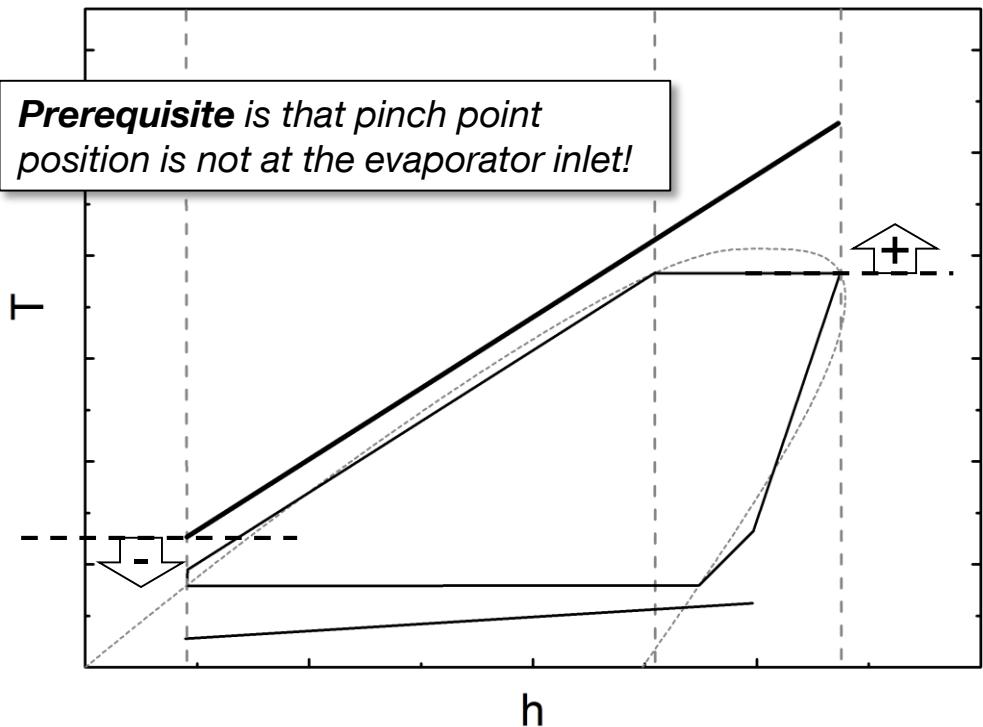

- Thermodynamic- and economic-related input parameters.
- Thermodynamic model based on a simple sub-critical ORC and OHST theory.
- Economic model based on geothermal power plant in Germany.
- LCOE as the main Obj. Function as it links thermodynamics with economics.

2. Approach – Input Parameters

| Thermodynamic-related | Economic-related |
|---|--|
| <ul style="list-style-type: none">• Heat Source<ul style="list-style-type: none">– Thermal water, 140 °C, 10 bar, 50 MW.• ORC Process<ul style="list-style-type: none">– Working conditions– machinery efficiencies– Plate Heat Exchange• Cooling Unit<ul style="list-style-type: none">– Cooling water, 8 °C, 1 bar• Reference state<ul style="list-style-type: none">– 8 °C, 1 bar | <ul style="list-style-type: none">• Initial investment cost<ul style="list-style-type: none">– Drilling– Equipment Costs– Others (Construction, labor, etc.)• Operation & Maintenance• Generals<ul style="list-style-type: none">– Annual discount rate: 8%– Lifetime: 25 years– Operation hrs: 8000 hrs– ... |

2. Approach – Thermodynamic Model (1)

Thermodynamic description

- System efficiency

$$\eta_{sys} = \eta_{th} \cdot \eta_{HT}$$

where

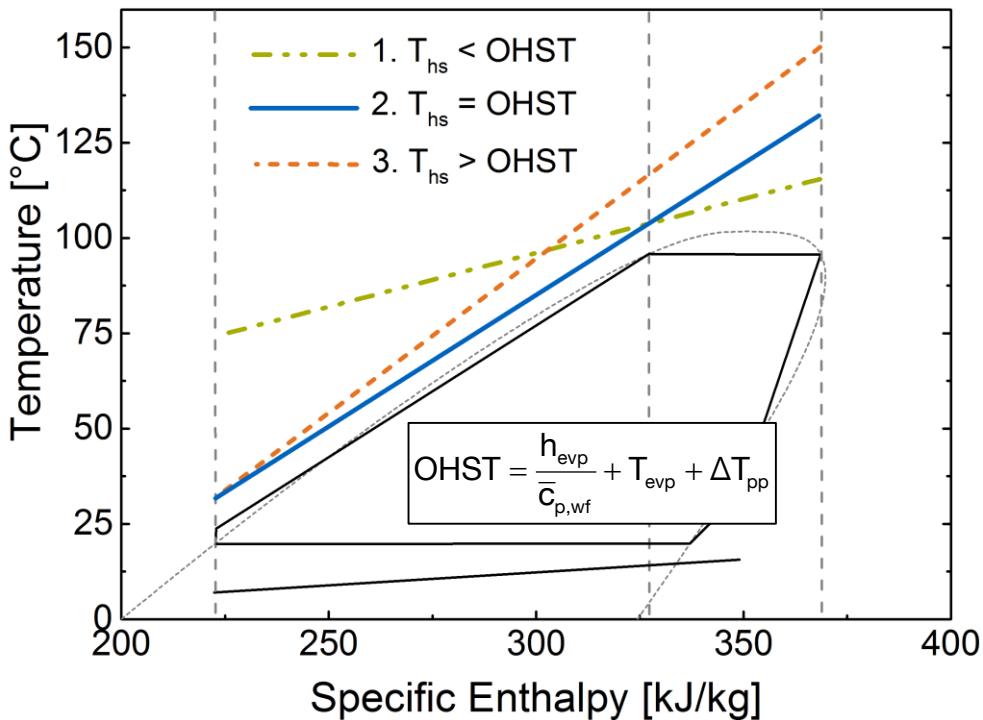

$$\eta_{th} = P_{el,net} / Q_{HT}$$

$$\eta_{HT} = Q_{HT} / Q_{hs}$$

- Practical means to improve η_{sys}
 - Increase evp. temperature $T_4 \rightarrow \eta_{th} \uparrow$
 - Decrease thermal water outlet temperature $T_8 \rightarrow \eta_{HT} \uparrow$

2. Approach – Thermodynamic Model (2)

| Optimal Heat Source Temperature (OHST)

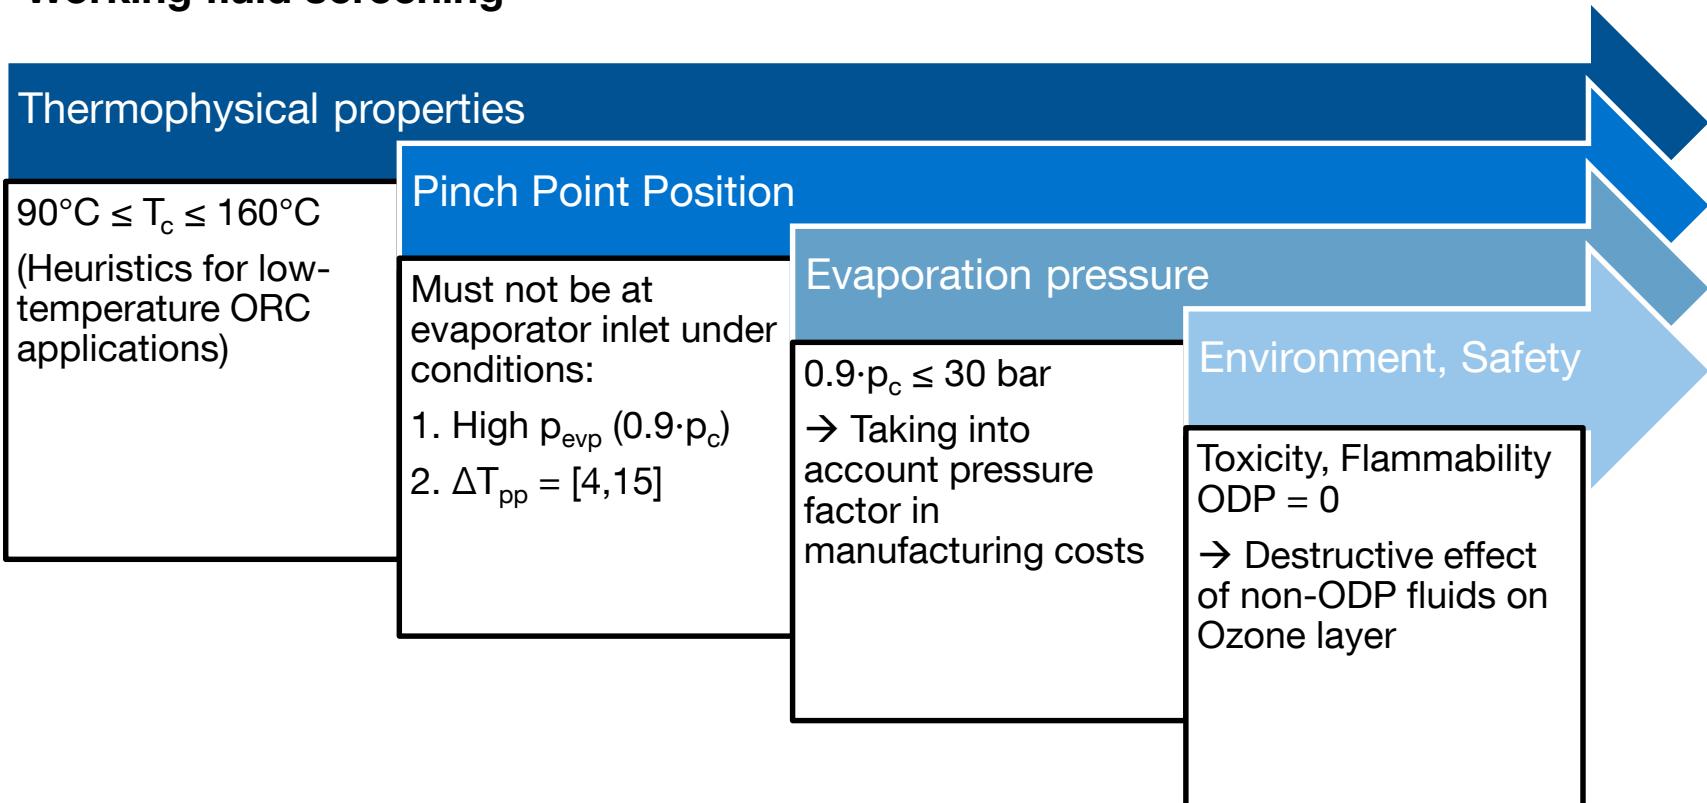

Thermodynamic optimization
based on OHST theory*

| Case | Pinch point Position | $p_{evp} \rightarrow \eta_{sys}$ |
|--------------------|----------------------|--|
| 1. $T_{hs} < OHST$ | Evaporator inlet | $\max \eta_{sys}$ at an intermediate p_{evp} |
| 2. $T_{hs} = OHST$ | Evenly in preheater | η_{sys} increases with a higher p_{evp} |
| 3. $T_{hs} > OHST$ | Preheater inlet | η_{sys} increases with a higher p_{evp} |

* Liu, et al. Optimal heat source temperature for thermodynamic optimization of sub-critical ORCs. Energy 2015.

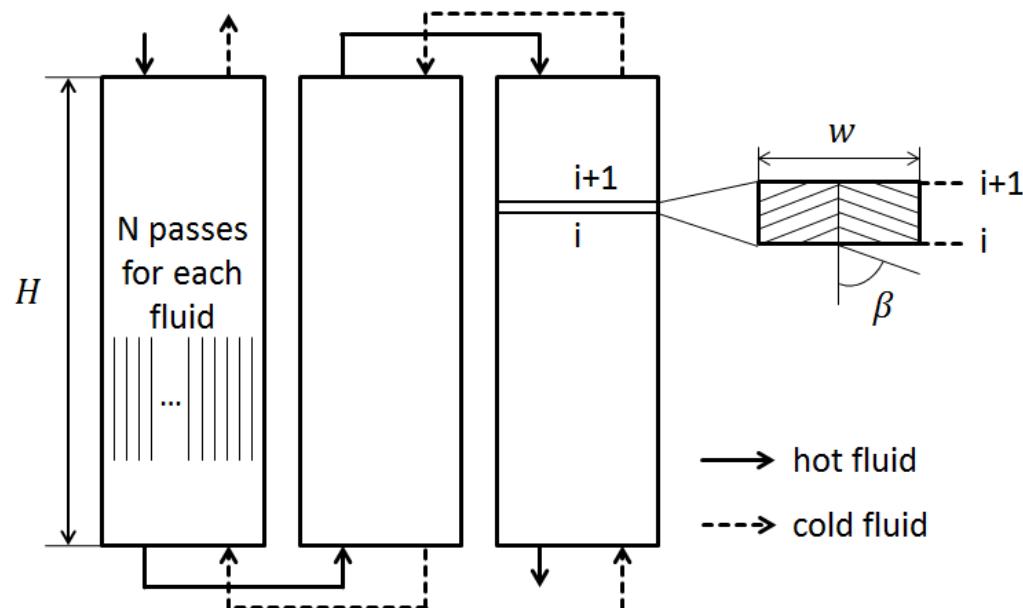

2. Approach – Thermodynamic Model (3)

Working fluid screening*

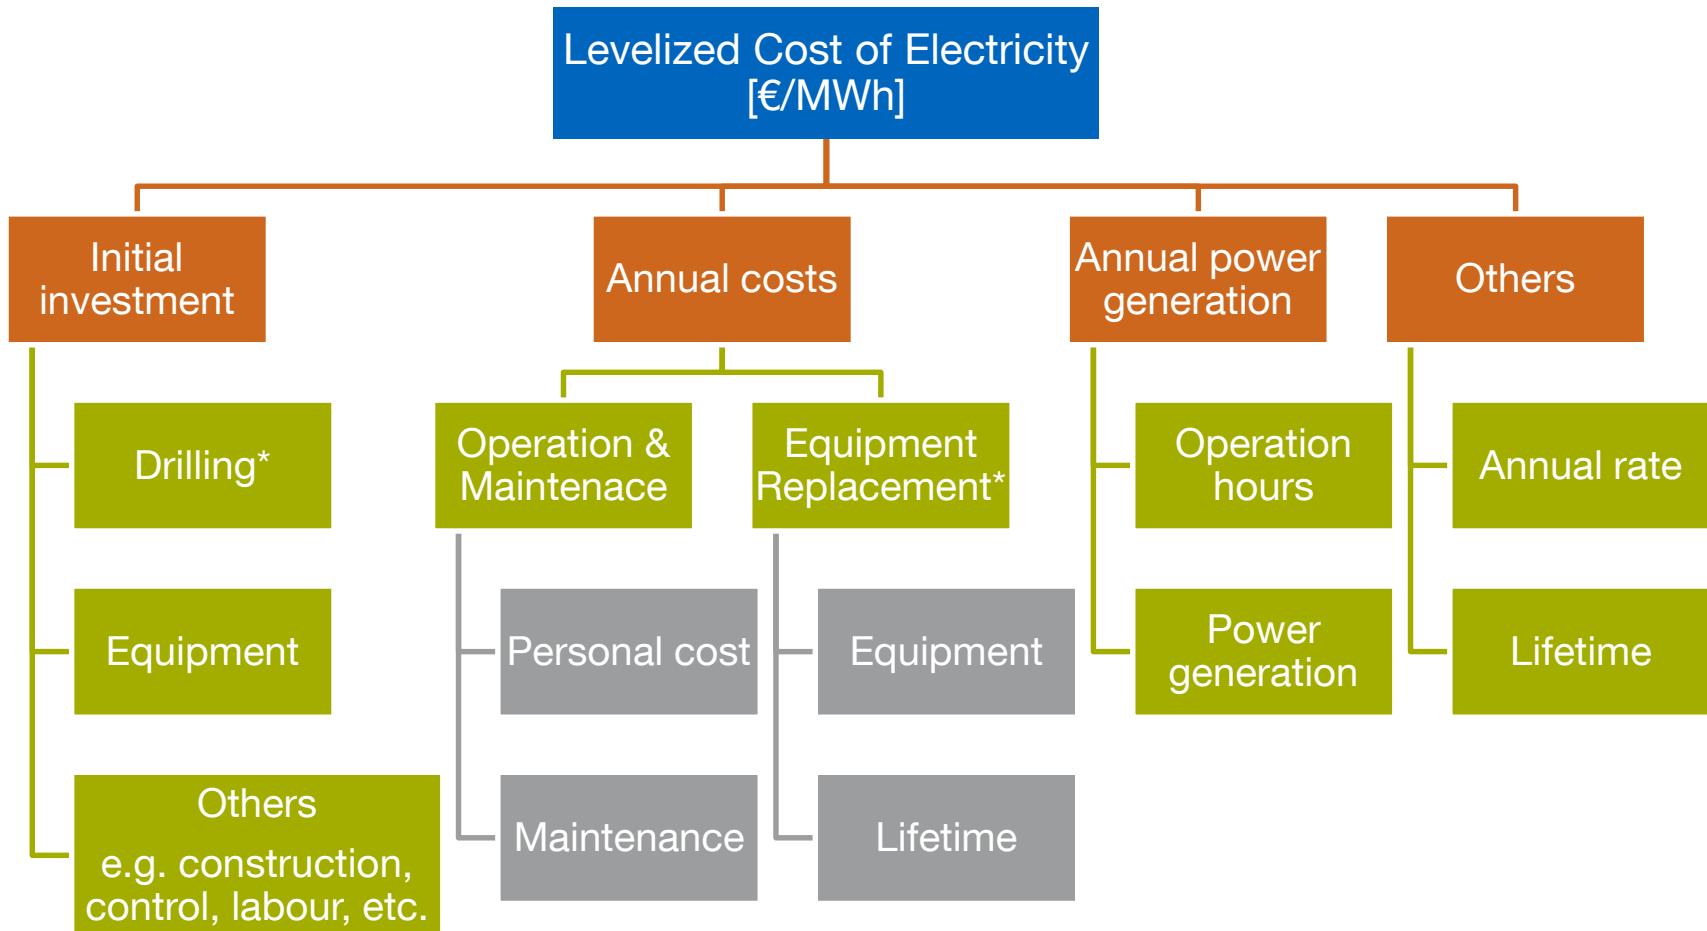

* Screening process based on 121 pure fluids from REFPROP 9.0.

2. Approach – Thermodynamic Model (4)

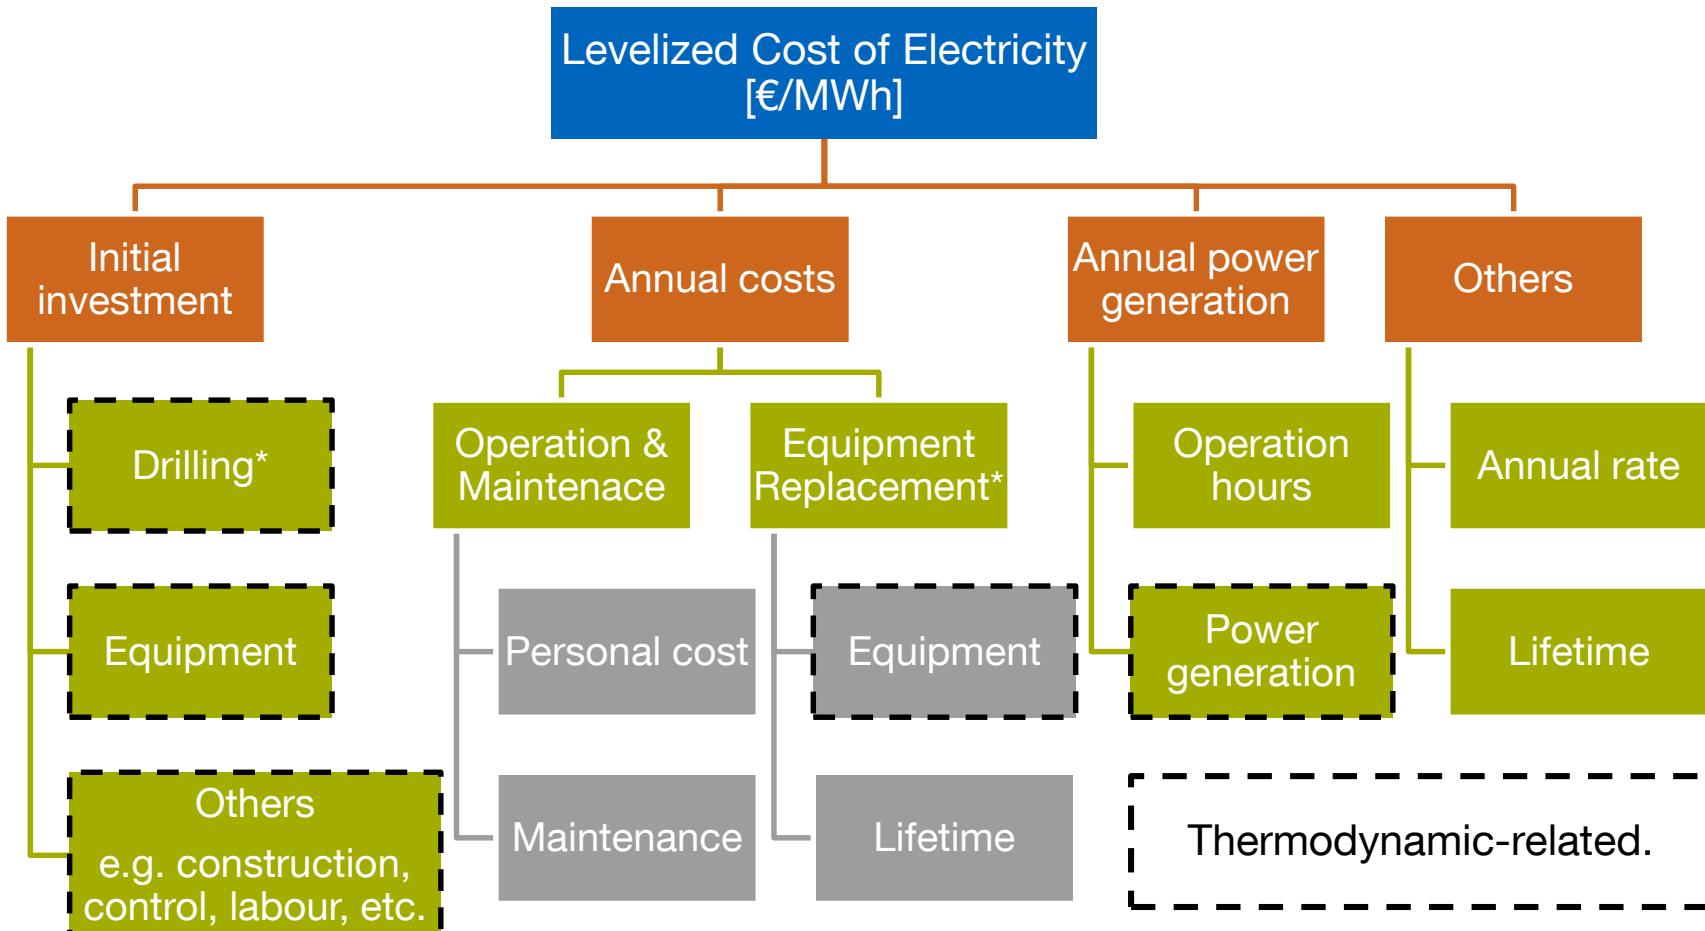

- Heat Transfer Process
 - exact pinch point position
 - required surface area

2. Approach – Economic Model

* Schlagermann, P., Exergoökonomische Analyse geothermischer Strombereitstellung am Beispiel des Oberrheingrabens. 2015

2. Approach – Economic Model

* Schlagermann, P., Exergoökonomische Analyse geothermischer Strombereitstellung am Beispiel des Oberrheingrabens. 2015

2. Approach – Target Function

-
- Thermodynamic optimization: $\max \underline{\text{System Efficiency}}$

$$\eta_{\text{sys}} = \frac{P_{\text{el,net}}}{\dot{Q}_{\text{hs}}}$$

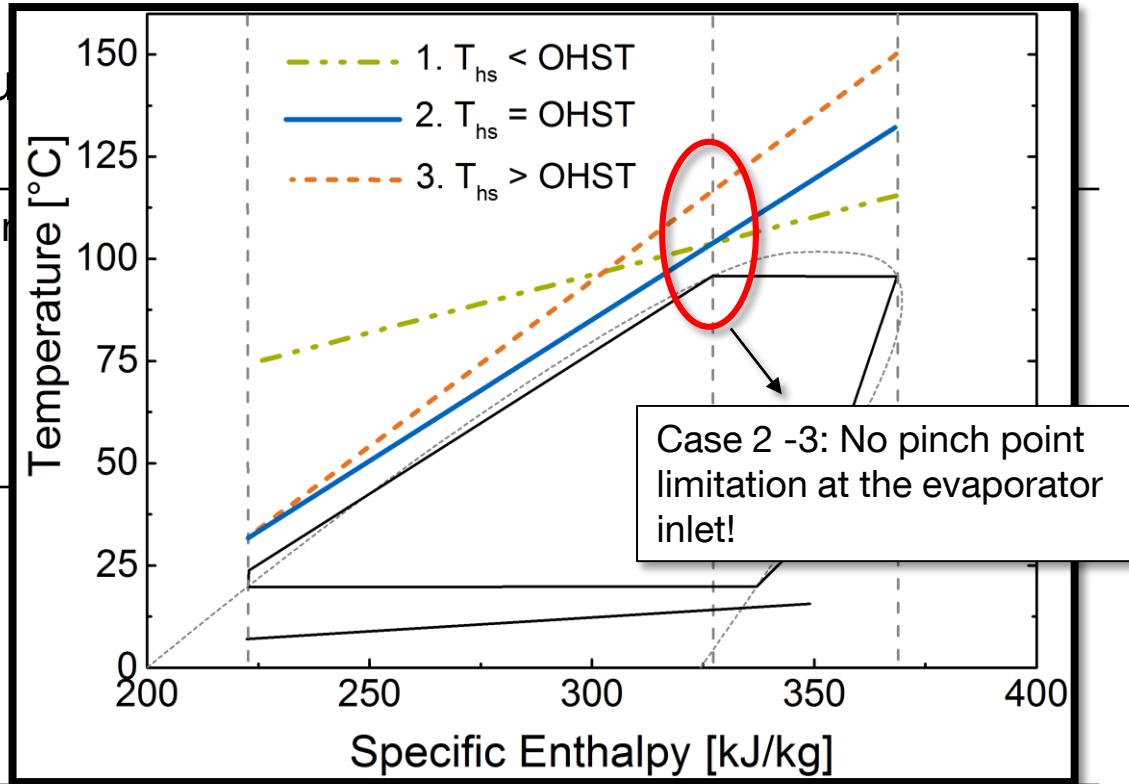

-
- Economic optimization: $\min \underline{\text{LCOE}}$

$$\text{LCOE} = \frac{I_0 + \sum_1^n \frac{A_t + I_t}{(1+r)^t}}{\sum_1^n \frac{W_{\text{el}}}{(1+r)^t}}$$

| | | |
|--|---------------------------------------|--|
| • Optimization Variable (p_{evp} or ΔT_{pp}): | Case 1. $T_{\text{hs}} < \text{OHST}$ | p_{evp} with $\min(\Delta T_{\text{pp}})$ |
| | Case 2. $T_{\text{hs}} = \text{OHST}$ | ΔT_{pp} with $p_{\text{evp}} = 0.9 \cdot p_c$ |
| | Case 3. $T_{\text{hs}} > \text{OHST}$ | ΔT_{pp} with $p_{\text{evp}} = 0.9 \cdot p_c$ |

2. Approach – Target Function

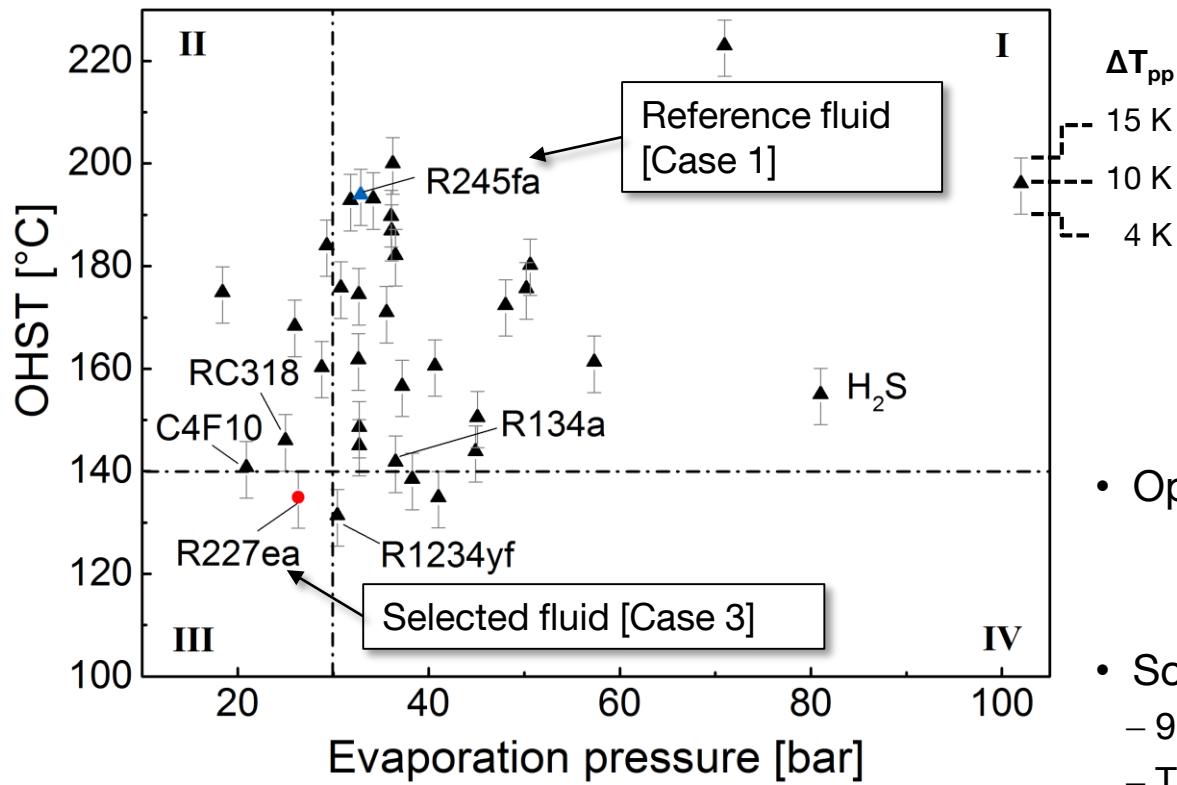

- Thermodynamic optimization:
- Economic optimization:

- Optimization Variable (p_{evp} or ΔT_{pp}):

| | |
|---------------------------|--|
| Case 1. $T_{hs} < OHST$ | p_{evp} with $\min(\Delta T_{pp})$ |
| → Case 2. $T_{hs} = OHST$ | ΔT_{pp} with $p_{evp}=0.9 \cdot p_c$ |
| → Case 3. $T_{hs} > OHST$ | ΔT_{pp} with $p_{evp}=0.9 \cdot p_c$ |

3. Results – Fluid Screening

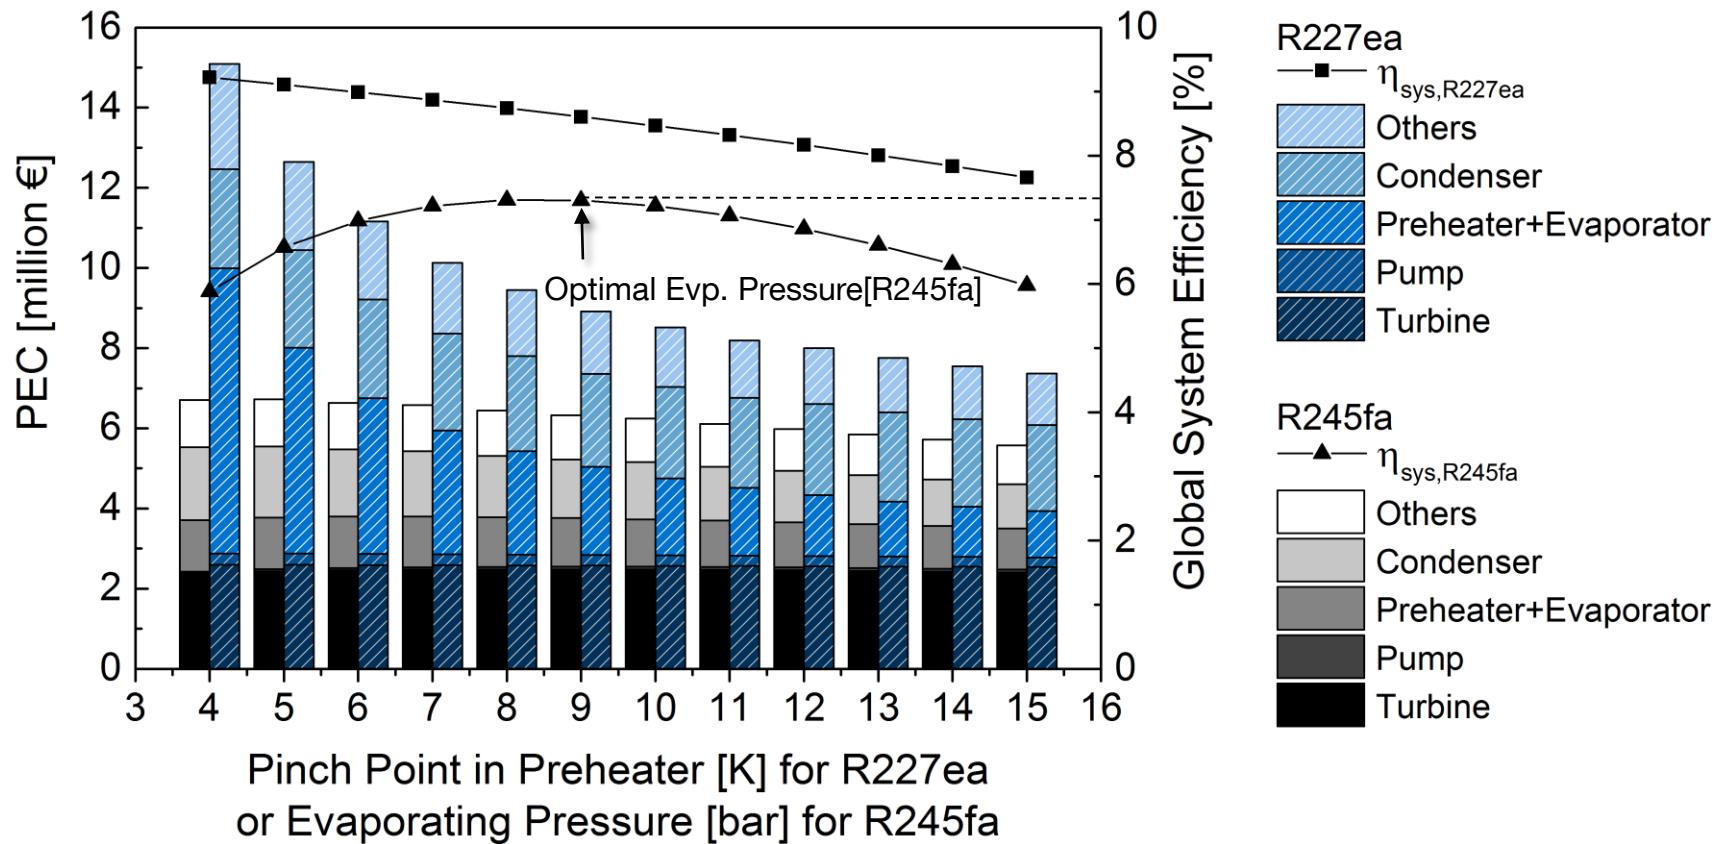

- Opt. Heat Source Temperature

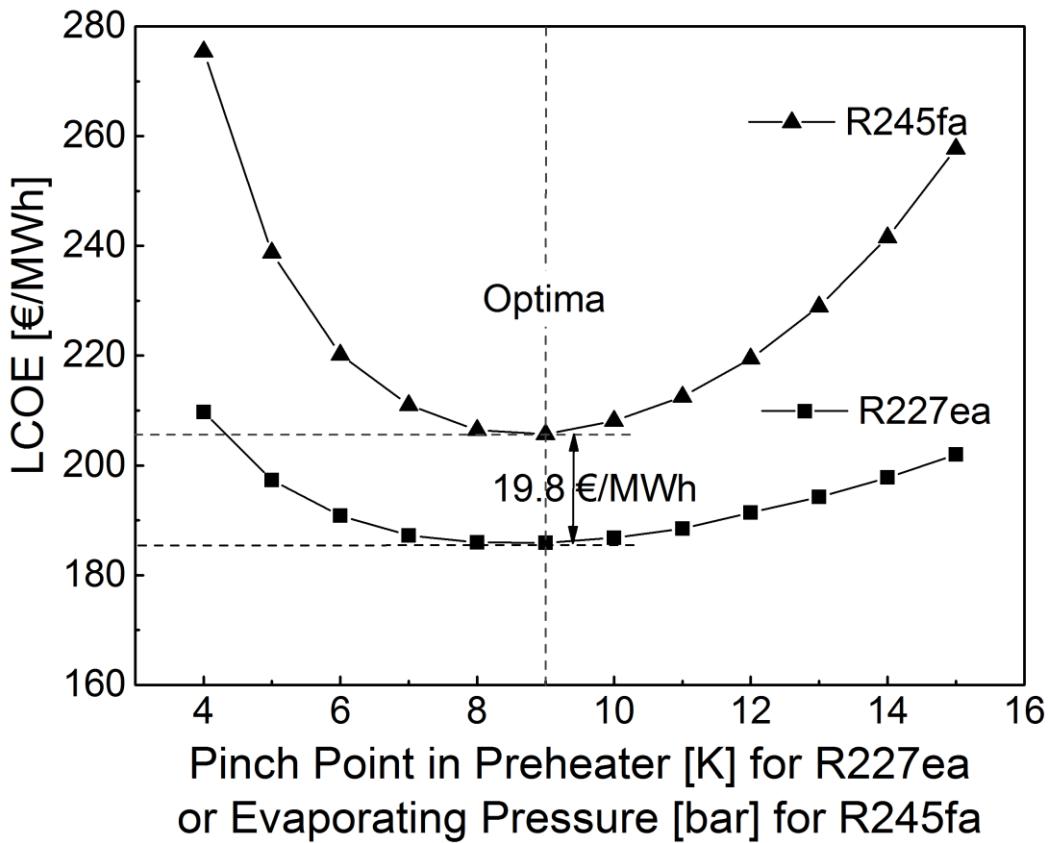

$$OHST = \frac{h_{evp}}{c_{p,wf}} + T_{evp} + \Delta T_{pp}$$

- Screening Criteria:
 - $-90^\circ C \leq T_c \leq 160^\circ C$;
 - $T_{hs} \geq OHST(0.9 \cdot p_c, 4 \leq \Delta T_{pp} \leq 15 K)$;
 - $0.9 \cdot p_c \leq 30 \text{ bar}$; - Env., Safety, ODP

3. Results – Parameter Variation

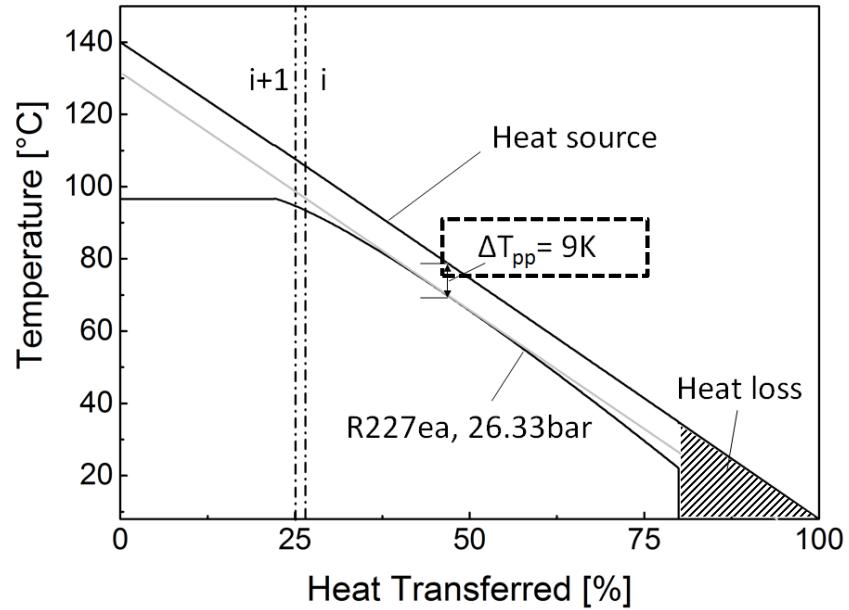

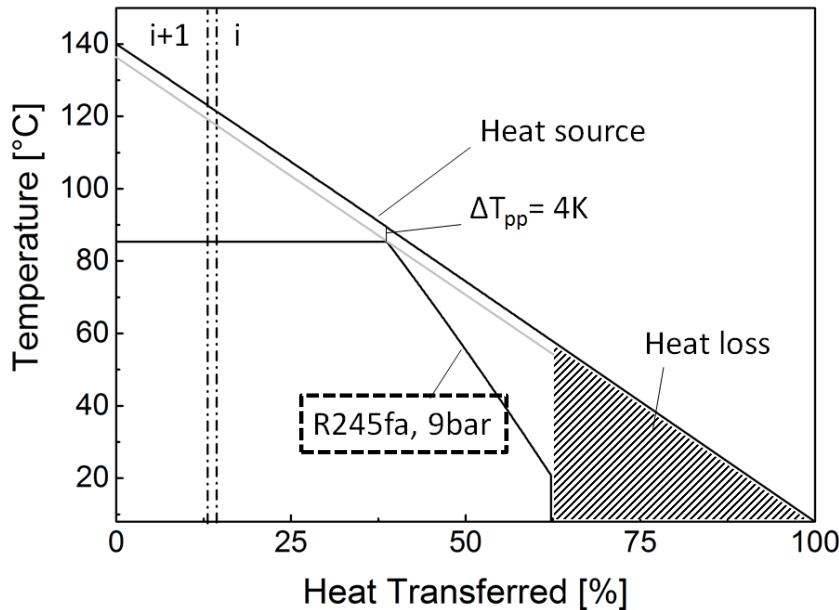

3. Results – Levelized Cost Of Electricity

$$LCOE = \frac{I_0 + \sum_{t=1}^n \frac{A_t + I_t}{(1+r)^t}}{\sum_{t=1}^n \frac{W_{el}}{(1+r)^t}}$$

- Optima based on minimum LCOEs
- 9.63% lower LCOE by R227ea compared to R245fa

3. Results – Optimal cases

| Fluid | Thermodynamic | | | | | | Economic | |
|--------|--------------------------|---------------------------|----------------------------|-------------------------|------------------------|--------------------------|---------------|-----------------|
| | T _{evp} [°C] | p _{evp} [bar] | T _{pp,evp} [K] | η _{sys} [%] | η _{HT} [%] | W _{el} [MWh] | PEC [m. €] | LCOE [€/MWh] |
| R227ea | 96.60 | 26.33 | 9.000 | 8.607 | 79.47 | 29006 | 8.739 | 185.9 |
| R245fa | 85.33 | 9.000 | 4.000 | 7.306 | 63.51 | 23762 | 7.306 | 205.7 |

4. Conclusions & Future works

- ✓ Technically feasible
 - Suitable working fluid selection → pinch point location not at evaporator inlet;
 - System efficiency strongly influenced by ΔT_{pp} .
- ✓ Economically viable
 - An optimum found for ΔT_{pp} where LCOE is minimized;
 - Despite higher PECs, a lower LCOE is resulted.

To-do

- Pressure drops to be considered through the ORC loops;
- Heat transfer mechanism for near-critical states

Thanks for your attention!

Questions?

Session 4: Thermoconomics I

Techno-Economic Analysis of Sub-critical ORC with optimized Heat Transfer Process

Wei Liu, Dominik Meinel, Christoph Wieland and Hartmut Spleithoff
Institute for Energy Systems
Technische Universität München

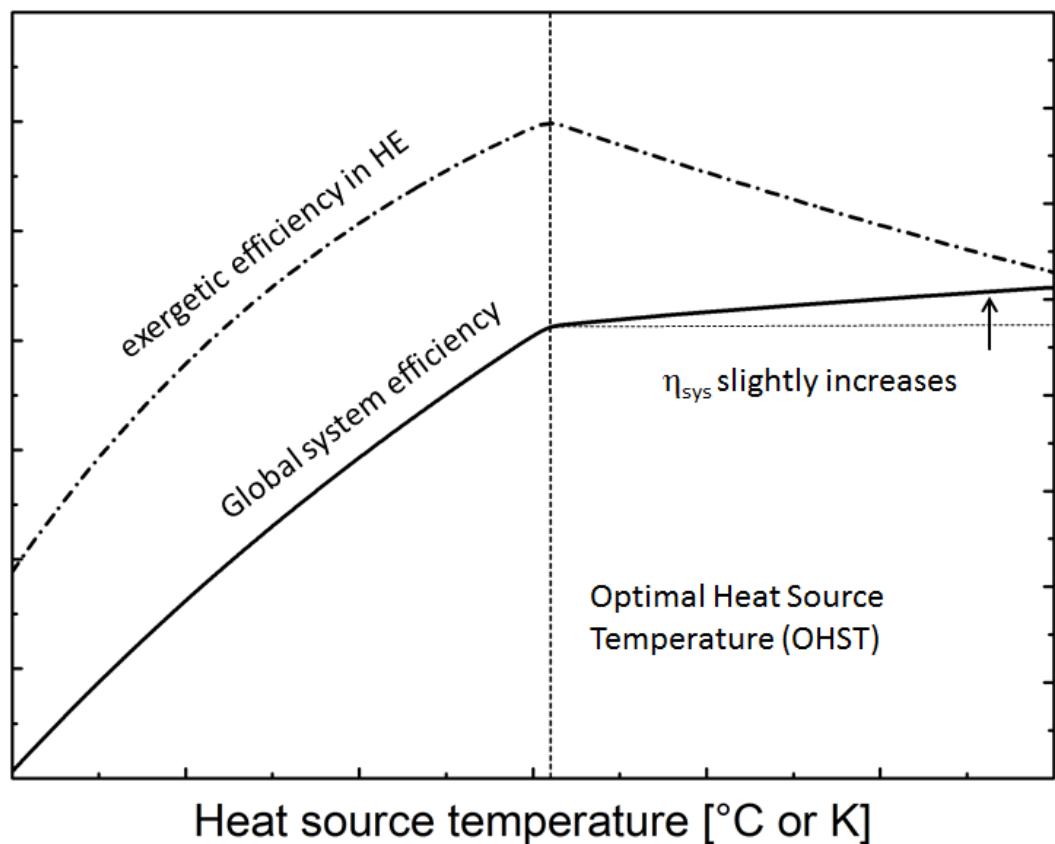

3rd International Seminar on ORC Power Systems

October 12-14, 2015, Brussels, Belgium

Appendix – The thermodynamic-related inputs

| | | | | | |
|-------------------------------|--------------------|----------|-------------------------------|---------------------|-------------|
| Heat source temperature | T_{hs} | 140 °C | Cooling water temperature | T_{cw} | 8 °C |
| Heat source pressure | p_{hs} | 10 bar | Cooling water pressure | p_{cw} | 1 bar |
| Heat source thermal amount | \dot{Q}_{hs} | 50 MW | Isentropic efficiency Turbine | $\eta_{is,turbine}$ | 0.85 |
| Evaporating pressure | p_{evp} | < 30 bar | Isentropic efficiency Pump | $\eta_{is,pump}$ | 0.75 |
| Pinch point in heat exchanger | $\Delta T_{pp,HE}$ | Variable | Mechanical efficiency | η_{mech} | 0.98 |
| Condensation temperature | T_{cond} | 20 °C | Generator/Motor efficiency | η_G/η_M | 0.95 |
| Pinch point in the condenser | ΔT_{cond} | 5 K | Reference state | p_0, T_0 | 1 bar, 8 °C |

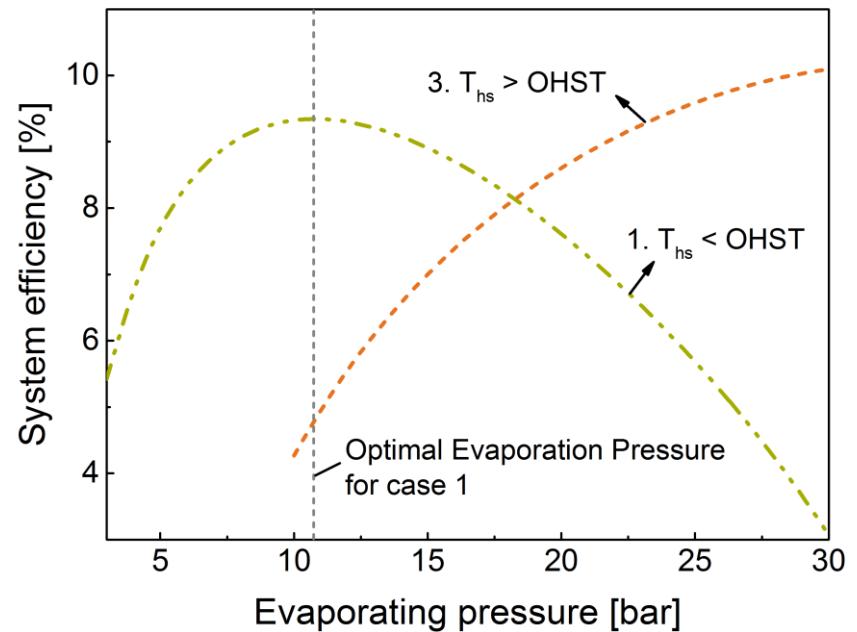

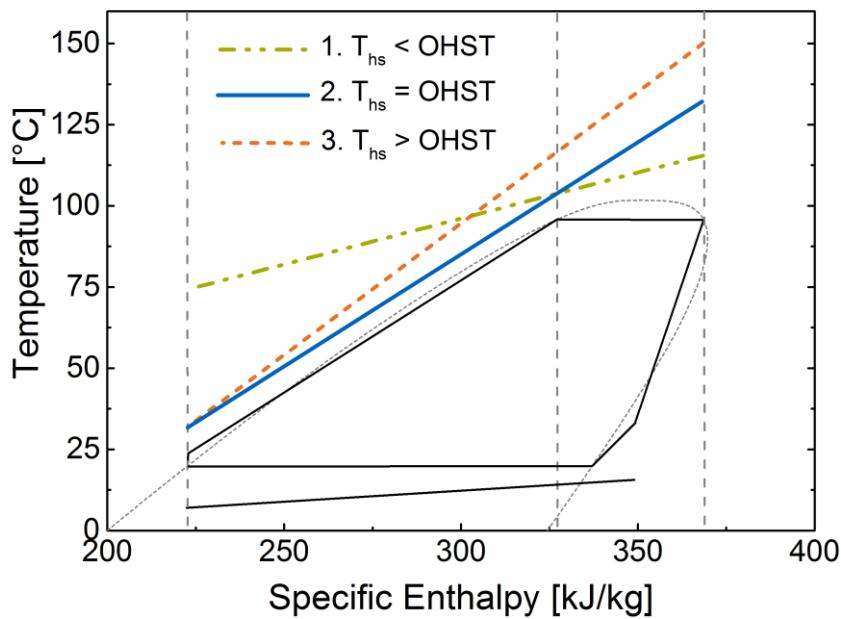

Appendix – Qualitative demonstration of OHST

OHST corresponds to:

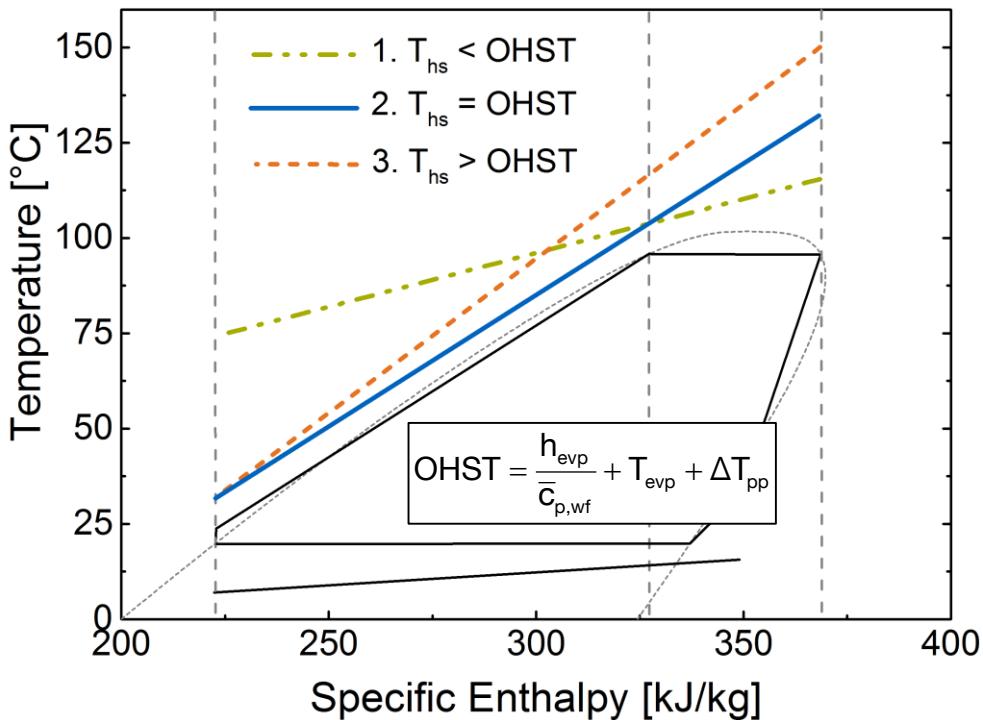

- an almost maximized η_{sys} ;
- Maximal exergetic efficiency in heat transfer process.

Appendix – Tendency prediction of η_{sys} for difference cases

Appendix – Optimal Heat Source Temperature

| Optimal Heat Source Temperature (OHST)

Thermodynamic optimization
based on OHST theory*

| Case | Pinch point Position | $p_{\text{evp}} \rightarrow \eta_{\text{sys}}$ |
|----------------------------------|----------------------|---|
| 1. $T_{\text{hs}} < \text{OHST}$ | Evaporator inlet | max η_{sys} at an intermediate p_{evp} |

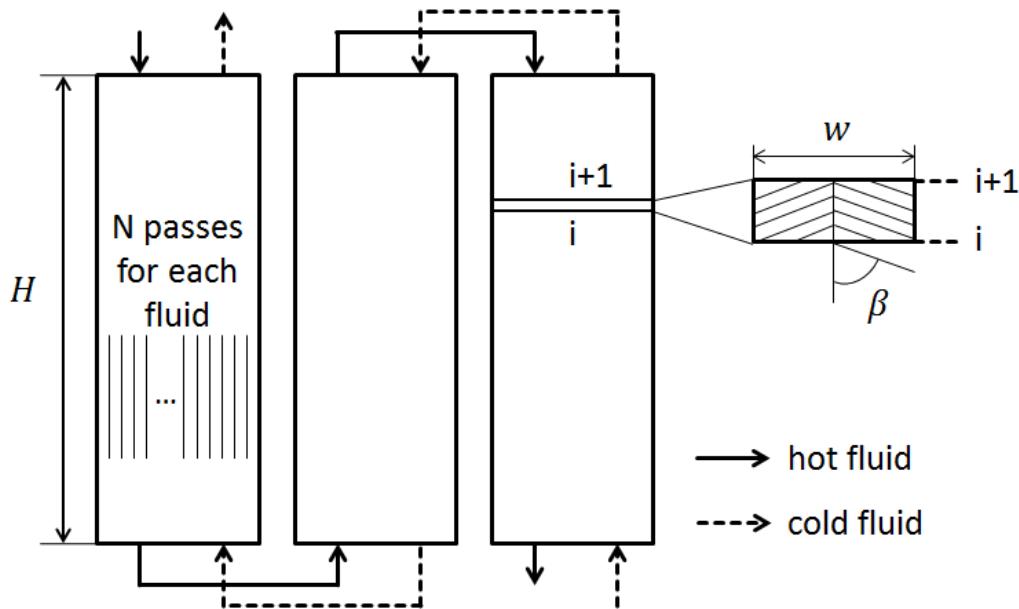

OHST is defined as a heat source temperature, for which system efficiency of ORC almost reaches maximum with a fluid at a constant sub-critical evp. pressure.

OHST depends on fluid's physical properties and pinch point temperature.

* Liu,et al. Optimal heat source temperature for thermodynamic optimization of sub-critical ORCs. Energy 2015.

Appendix – Heat transfer process

Aim: 1) exact pinch point position; 2) required surface area.

Heat Transfer Process

- Assumptions:
 - Stationary process,
 - Zero pressure drop.
- Plate Heat Exchanger
 - three-pass counter flow,
 - Predefined geometries for plates.
→ adjustable # of plate.
- Mathematical Model
 - Discretized heat transfer process
 - Single phase fluid
Chisholm and Wanniarachchi
 - Multiple phase fluid
*Yan and Lin for evaporation**
Yan for condensation

* Evaporation model is modified for a continuous heat transfer coefficient.

Appendix - LCOE

Net Present Value (NPV): the sum of the present values of incoming and outgoing cash flows over a period of time.

$$K_0 = -I_0 + \sum_{t=1}^n \frac{E_t - A_t}{(1+i)^t}$$

- K_0 : NPV,
- I_0 : Investment,
- E_t : Incoming cash of year t,
- A_t : outgoing cash of year t,
- t : year of operation,
- n : period of operation,
- i : annual interest.

Assuming $K_0 = 0$, one has:

$$\sum_{t=1}^n \frac{-E_t}{(1+i)^t} = I_0 + \sum_{t=1}^n \frac{A_t}{(1+i)^t}$$

$$LCOE = \frac{I_0 + \sum_{t=1}^n \frac{A_t}{(1+i)^t}}{\sum_{t=1}^n \frac{W_{el}}{(1+i)^t}}$$

$$= \frac{\frac{I_0}{\sum_{t=1}^n \frac{1}{(1+i)^t}} + A_t}{W_{el}}$$
